CUSTOMER ANALYTICS BRIEFING | RETAIL BANKING PORTFOLIO

# Bank churn is concentrated in a few high-risk segments

A targeted analysis across 10,000 customers pinpointing exposure by demographic, engagement, and product holdings.

**Analytics & Data Team Briefing**
Cohort analysis · Python, SQL, and Power BI pipeline

DATA PIPELINE & BASELINE METRICS

# The analysis combines Python, SQL, and Power BI into one workflow

## Pipeline

01 **Python** — Clean and engineer features.

02 **MySQL** — Segment and quantify risk.

03 **Power BI** — Monitor results.

Dataset

**10,000**

Retail-bank customers across France, Spain, and Germany.

Overall churn

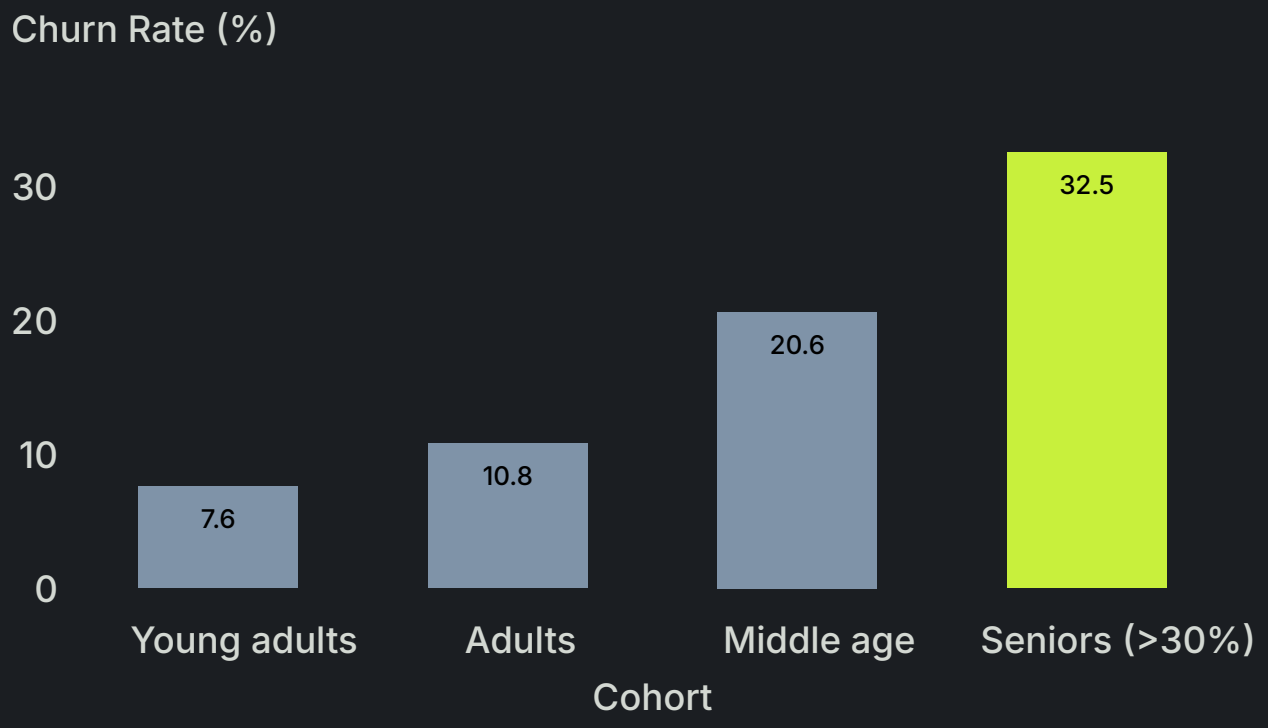

**20.4%**

2,037 customers churned versus 7,963 retained.

Made with GAMMA

DEMOGRAPHIC & GEOGRAPHIC CONCENTRATION

# Age and country reveal where churn risk is highest

Customer churn escalates sharply across lifecycle tiers, steepening after age 45.

GEOGRAPHIC DISPERSION

## Germany leads regional loss

France (16.2%) and Spain (16.7%) track closely, while Germany exhibits substantially elevated overall churn.

HIGHEST-RISK INTERSECTION

**61.6%**

**German seniors** churn at nearly triple the bank baseline, presenting the primary portfolio vulnerability.

BEHAVIORAL MATRIX

# Product count and activity separate loyal customers from at-risk ones

| PRODUCT SEGMENT | CHURN | FINDING |
| --- | --- | --- |
| Two-product customers | Active: 5.6%; inactive: 9.9% | Most loyal |
| Single-product customers | Active: 18.9%; inactive: 36.7% | More exposed |
| Three-product inactive segment | 88.2% | Small group: 153 customers |

Made with GAMMA

ACTION PLAN

# The retention strategy should focus on three measurable interventions

01

## Prioritize

Personal outreach and tailored offers for German senior customers.

02

## Reactivate

Engage inactive single-product customers before they leave.

03

## Expand

Promote a relevant second product, while investigating the small three-product segment for pricing, service, or product-fit issues.

Made with GAMMA

# Turn the analysis into a monthly retention operating loop

- Use the retention-target query to create a monthly watch list of high-risk customers who have not yet churned
- Track segment movement in the Power BI dashboard with gender and age-group filters
- Next analytical step: validate the associations with longer time-series data and a churn model such as logistic regression or random forest
